PART	I – QUALI	TY ASSURANCE	
Code	REF	Item Description	
	1.1 Quality Assurance (QA) Plan		
K	5, 8	1.1.1 Written Plan adequately covers all the following: (check $\sqrt{\text{those that apply}}$)	
		a. Organization of the laboratory.	
		b. Staff training requirements.	
		c. Standard operating procedures.	
		d. Internal quality control measures for equipment, their calibration, maintenance,	
		repair, performance and rejection criteria established.	
		e. Laboratory safety.	
		f. Internal performance assessment.	
		g. External performance assessment.	
C	5	1.1.2 QA Plan is implemented.	
		1.2 Educational/Experience Requirements	
C	State's		
С	Human	1.2.1 In state/county laboratories, the supervisor meets the state/county	
	Resources	educational and experience requirements for managing a public health	
	Department	laboratory.	
K	State 2 -		
	State's Human	1.2.2 In state/county laboratories, the analyst(s) meets the state/county educational and	
	Resources	experience requirements for processing samples in a public health laboratory.	
	Department		
С	USDA	1.2.3 In commercial/private laboratories, the supervisor must have at least a	
C	Microbiology	bachelor's degree or equivalent in microbiology, biology, chemistry, or	
	& EELAP		
		another appropriate discipline with at least two years of laboratory	
		experience.	
K	USDA		
	Microbiology	1.2.4 In commercial/private laboratories, the analyst must have at least a high school	
	& EELAP	diploma and shall have at least three months of experience in laboratory	
		sciences.	
С	5	1.2.5 LC-Operator must be competent in the operation and maintenance of a	
	5	basic liquid chromatography system.	
0	5 0	1.3 Work Area 1.3.1 Adequate for workload and storage.	
0	5,8	1.3.2 Clean and well lighted.	
0	8 8	1.3.3 Adequate temperature control.	
0			
0	8	1.3.4 All work surfaces are nonporous and easily cleaned.	
	6	1.4 Laboratory Equipment.	
O K	6 6	1.4.1 The pH meter has a standard accuracy of 0.1 unit.1.4.2 pH paper in the appropriate range (i.e. 1-4), if used, is used with minimum	
	0	accuracy of 0.5 pH units.	
K	10	1.4.3 pH electrodes consist of pH half-cell and reference half-cell or equivalent	
	10	combination electrode/triode (free from Ag/AgCl or contains an ion exchange	
		barrier to prevent passage of Ag ions into the medium that may result in	
		inaccurate pH readings).	

Paralytic Shellfish Poisoning (PSP HPLC-PCOX)

K	5	1.4.4 pH meter is calibrated daily when in use. Results are recorded and records are
K	5	maintained.
K	8	1.4.5 Effect of temperature has been compensated for by an ATC probe, use of a triode
		or by manual adjustment.
K	8	1.4.6 A minimum of two standard buffer solutions is used to calibrate the pH meter.
		The first must be near the electrode isopotential point (pH 7). The second must
		be near the expected sample pH (i.e. pH 2, 4 or 11) as appropriate. Standard
		buffer solutions are used once and discarded.
Κ	5, 11	1.4.7 Electrode acceptability is determined daily or with each use following either
		slope or millivolt procedure.
Κ	6	1.4.8 The balances being used provide an appropriate sensitivity at the weights of use,
		at least 0.1 g for laboratory precision balances and 0.1 mg for analytical
		balances.
K	8, 9	1.4.9 The balance calibration is checked monthly using NIST class S, ASTM class 1
	1	or 2 weights or equivalent. Results are recorded and records are maintained.
K	1	1.4.10Refrigerator temperature is maintained between 0 and 4 °C.
Κ	8	1.4.11Refrigerator temperature is monitored at least once daily. Results are recorded
17	1	and records maintained.
K	1	1.4.12Freezer temperature is maintained at -20 °C or below.
K	8	1.4.13Freezer temperature is monitored at least once daily. Results are recorded and
С	13	records maintained.
K	5	1.4.14 All in-service thermometers are properly calibrated and immersed.1.4.15 All glassware is clean.
K	3	
ĸ	3	1.4.16A high performance liquid chromatography system (HPLC) equipped with the following is used:
		a. binary mobile phase system delivering a pulse-free flow of 0.5-2.0 mL/min,
		b. solvent degasser,
		c. autosampler (refrigerated preferred) with loop suitable for 5-30 μ L injections,
		d. temperature controlled column compartment capable of controlling temperature
		between $10 - 50$ °C, and
		e. fluorescence detector able to achieve the required sensitivity at an excitation
		wavelength (λ) of 330 nm and emission of 390 nm.
Κ	3, 4	1.4.17The post-column reaction system used is equipped with the following:
		a. reactor module capable of maintaining 85 °C,
		b. dual reagent pumps capable of delivering accurate flows of 0.4 mL/min, and
		c. if applicable, a reaction coil (knitted or equivalent) having a total volume of 1
		mL and a length of 5 m x 0.5 mm.
Κ	6	1.4.18Autopipettors are calibrated for the appropriate volumes used and checked
		annually for accuracy. Results are recorded and records are maintained.
K	3	1.4.19A boiling water bath with sufficient volume to cover the sample/acid mixture is
		used for extraction.
0 V	3	1.4.20Centrifuge capable of holding 50 mL polypropylene tubes.
Κ	3	1.4.21 Microcentrifuge capable of holding 1.5 mL microcentrifuge tubes and generating
		a minimum of 16000 g or equivalent is used.
C	3	1.5 Reagents and Reference Solution Preparation and Storage
C C	3 8	1.5.1 All solvents and reagents used are analytical or LC grade materials.1.5.2 Water is glass distilled or deionized and exceeds 0.5 megaohm resistance or
U	o	$1.5.2$ water is glass distinct or defonized and exceeds 0.5 megaonin resistance or is less than 2 μ Siemens/cm conductivity at 25 °C to be tested and recorded
		monthly for resistance or conductivity and the results are recorded.
K	8	1.5.3 Water is analyzed for residual chlorine monthly and is at a nondetectable level
17	0	Paralytic Shellfish Poisoning (PSP HPLC-PCOX)

Paralytic Shellfish Poisoning (PSP HPLC-PCOX)

		$(\leq 0.1 \text{ ppm})$ Results are recorded and records are maintained.
Κ	8	1.5.4 Water contains < 100 CFU/ml as determined monthly using the heterotrophic
		plate count method. Results are recorded and records are maintained.
Κ	8	1.5.5 Reagents are properly stored and labeled with the date of receipt, date opened or
		date prepared and expiration date.
С	3	1.5.6 The binary mobile phase system used to analyze the GTX and STX toxins
		consists of:
		1.5.6.1 Mobile Phase A, which contains 11 mM heptane sulfonate and 5.5 mM
		phosphoric acid (H ₃ PO ₄), pH 7.1.
		1.5.6.2 Mobile Phase B, which contains 11 mM heptane sulfonate, 16.5 mM H ₃ PO
		and11.5% acetonitrile (MeCN), pH 7.1.
С	3	1.5.7 The binary mobile phase system used to analyze the C toxins consists of
		1.5.7.1 Mobile Phase A, which contains 2 mM tetrabutyl ammonium phosphate,
		рН 5.8.
		1.5.7.2 Mobile Phase B, which contains 2 mM tetrabutyl ammonium phosphate in
		4% acetonitrile, pH 5.8.
С	3	1.5.8 The post-column oxidant consists of 100 mM H ₃ PO ₄ and 5 mM periodic
		acid (H5IO6), pH 7.8.
С	3	1.5.9 The post-column acid used is 0.75 M nitric acid (HNO ₃).
С	3	1.5.10The heptane sulphonate used in mobile phase A and mobile phase B to
		analyze for GTX and STX toxins is prepared the day of use or refrigerated
		for up to one week.
С	3	1.5.11 The pH of mobile phases and the post-column oxidant are adjusted as
		follows:
		a. Mobile phase A and mobile phase B for the GTX and STX toxins are
		adjusted to 7.1 with ammonium hydroxide (NH4OH),
		b. Mobile phase A and mobile phase B for the C toxins are adjusted to 5.8 in
		one direction only with 10% acetic acid (HOAc) if too basic or 1% NH4OH
		if too acidic, and
		c. The post-column oxidant is adjusted to 7.8 with 5 M sodium hydroxide
		(NaOH).
0	3	d. Mobile phases and post-column reagents are filtered before use if the HPLC does
		not have a degreaser.
С	3,7	1.5.12Only certified reference materials are used for standard solutions. Source
		of the reference standard:
С	7	1.5.13NRC Zero-Mus or a negative control matched matrix is used as a matrix
		blank as appropriate. Source of the negative
		matrix:
С	7	1.5.14All primary standards are stored appropriately as per supplier
		recommendations.
С	7	1.5.15All standards used are within expiration date.
С	3	1.5.16All standards are prepared gravimetrically.
Κ	3	1.5.17Intermediate mixes of primary standards are made up in 0.003 M HCl for the
		GTX/STX toxins or pH 5 glass distilled/deionized water for the C toxins labeled
		with the date of preparation and the expiration date and stored appropriately.
		The pH of the glass distilled/deionized water is adjusted when necessary by the
		dropwise addition of 10% acetic acid (HOAc).
С	3	1.5.18Working standards are made up from primary standard or intermediate
		mixes by dilution with toxin-free, deproteinated, matrix matched extracts.
С	7	1.5.19Zero-Mus is stored according to manufacturer's instructions.

С	2	1.5.20Quality Control shellfish tissues are stored frozen.
С	7	1.5.21 Working standards are labeled with the date of preparation, stored
		appropriately and used within 3 months of preparation.
		1.6 Collection and Transportation of Samples
0	6	1.6.1 Shellstock are collected in clean, waterproof, puncture resistant containers.
Κ	6	1.6.2 Samples are appropriately labeled with the collector's name, type of shellstock,
		the harvest area, and time and date of collection.
С	6	1.6.3 Immediately after collection, shellstock samples are placed in dry storage
		(ice chest or equivalent) which is maintained between 0 and 10 °C with ice
		or cold packs for transport to the laboratory.
K	14	1.6.4 Time from collection to initiation of the extraction should not exceed 24 hours. However, if significant delays are anticipated or if they occur, the laboratory has an appropriate contingency plan in place to handle the samples. For samples
		shipped live in accordance with 1.6.3, the contingency plan ensures samples remain within allowable temperature tolerances and animals are alive upon receipt. The contingency plan also addresses field and/or laboratory processing
		that ensures the integrity of the sample or extract until initiation of the assay.For example, samples are washed, shucked, drained and processed as follows:a. refrigerated or frozen until extracted;
		b. homogenized and frozen until extracted; or
		c. extracted, the supernatant decanted, and refrigerated or frozen until assayed.
С	6	1.6.5 Frozen shucked product or homogenates are allowed to thaw completely and all liquid is included as part of the sample before being processed
		further.

Paralytic Shellfish Poisoning (PSP HPLC-PCOX)

K	3	2.2.4 Homogenate/acid mixture is vortexed thoroughly before boiling to completely mix the contents.
С	3	2.2.5 To prevent toxin transformation, the pH of the homogentate/acid mixture before boiling is 3.0 ± 1.0, adjusted if necessary with the dropwise addition of either 5 M HCl to lower the pH or 0.1 M NaOH to raise the pH.
С	3	2.2.6 Samples in capped 50 mL polypropylene centrifuge tubes are extracted in a boiling water bath for 5 minutes.
К	3	2.2.7 The pH of the cooled mixture after boiling is 3.0 ± 1.0 , adjusted if necessary with the dropwise addition of 5 M HCl. Any sample with a pH of less than 2.0 is discarded and extracted again.
K	3	2.2.8 The homogenate/acid mixture is allowed to separate by gravity or by centrifugation.
<u> </u>		2.3 Deproteination
С	3	2.3.1 500 µL of sample extract is deproteinated with 25 µL of 30% trichloroacetic
G		acid, vortexed thoroughly and centrifuged at ~ 16,000 g for 5 minutes.
С	3	2.3.2 The pH of the deproteinated extract is adjusted with 35 μL of 1.0 M NaOH
K	3	vortexed thoroughly and centrifuged at ~ 16,000 g for 5 minutes.
K	3	2.3.3 An aliquot of the deproteinated supernatant is filtered through a 0.2 μ m filter.
C	2	2.4 Analysis
С	2	2.4.1 A standard calibration curve (of at least six concentrations) is performed
		upon initial instrument set up, following any major hardware maintenance
		activity, an when the continuing calibustion varification (CCV) in disctor
		activity, or when the continuing calibration verification (CCV) indicates significant drift (> 200 / for individual toyin) from the calibration. Deputts

K K	3	 significant drift (> 30% for individual toxin) from the calibration. Results are recorded and records are maintained. 2.4.2 10 µL is injected for GTX/STX toxins and 5 µL is injected for C-toxins. 2.4.3 Samples are stored in the sample compartment of the autosampler at 4 °C during analysis. Otherwise samples must be analyzed within 20 hours if the autosampler is held at room temperature. 2.4.4 A column heater that is capable of maintaining 30-40 °C for the GTX/STX toxins and 10-20 °C for the C toxins is used in the analysis. 2.4.5 The appropriate analytical column is used. a. GTX/STX Toxins: Agilent Zorbax Bonus-RP column, 4.6 mm x 150 mm, 3.5 µm or equivalent. b. C Toxins: Thermo BetaBasic 8, 4.6 mm x 250 mm, 5 µm or equivalent.

С	3	2.5.2 The resolution and retention time criteria that must be met are:		
		 a. For GTX and STX toxins, the matrix peak must be at least 70% baseline resolved between GTX3 and GTX2. b. For GTX and STX toxins, GTX5 must be at least 40% baseline resolved between dcGTX3 and dcGTX2. c. For GTX and STX toxins, dcSTX and STX must be at least 70% baseline resolved. d. For GTX and STX toxins, the retention time of GTX4 must be between 5 and 7 minutes. e. For the C toxins, C2 must be at least 70% baseline resolved between C1 and C2. f. For the C toxins, the retention time of C1 must be between 4 and 7 minutes. 		
С	2	2.5.3 Daily injection schedules must include the adequate frequency of injection		
		standards based on an assessment of individual standard toxin variability. Variability in peak response must be less than 10% for calculation of		
		toxicity in samples.		
		2.6 Calculation of Toxicity		
С	4	2.6.1 The toxicity of the individual toxins is calculated as follows:		
		$\mu gSTXdiHCleq/100g = \mu M \times \frac{372.2}{1000mL} \times \frac{Fvol}{Ext.vol} \times \left(\frac{Wt + Vol}{Wt}\right) \times ReTx \times 100$ ^{14.} Where: μM = Concentration of toxin in the extract, in μM ; $Fvol$ = Final volume of the deproteinized extract (e.g. 560 μ L); $Ext.vol$ = Volume of crude extract used (e.g. 500 μ L); Wt = Weight of sample used;		
		Vol = Volume of acid extractant used (e.g. 5 mL); and		
		ReTx = Relative toxicity of toxin vs. Saxitoxin.		
		Relative Toxicity Values		
		ToxinReTxToxinReTxGTX10.9940NEO0.9243		
		GTX2 0.3592 STX 1.0000		
		GTX3 0.6379 dcSTX 0.5131		
		GTX4 0.7261 C1 0.0060		
		GTX5 0.0644 C2 0.0963		
		dcGTX2 0.1538 C3 0.0133		
		15. dcGTX3 0.3766 C4 0.0576		
C	3	2.6.2 The individual toxicities for each toxin are summed to obtain the overall sample toxicity in ug STX equivalents/100 g ($ug/100$ g)		
С	12	sample toxicity in μg STX equivalents/100 g (μg/100 g).2.6.3 Any value at or above 80 μg STX equivalents /100 g of meat is actionable.		
U	14	2.0.5 Any value at of above ov µg 51A equivalents/100 g of meat is actionable.

A. Results	
Total# of Critical(C) Nonconformities Total# of Key (K) Nonconformities Total# of Critical, Key, and Other (O) Nonconfomities	
B. Criteria for Determining Laboratory Status of the PS	SP, PCOX Component
 Conforms Status: The PSP, PCOX component of requirements if all of the following apply. a. No Critical nonconformities. b. and <6 Key nonconformities. c. and <12 Total nonconformities. Provisionally Conforms Status: The PSP, PCOX provisionally conforming to NSSP requirements if a a. the number of critical nonconformities. c. and <6 Key nonconformities. c. and <12 Total nonconformities. Does Not Conform Status : The PSP, PCOX comprequirements when any of the following apply. a. The total # of Critical nonconformities is ≥ 6 b. or the total # of Key nonconformities is ≥ 6 c. or the total # of Critical, Key, or Other is ≥ 	component of this laboratory is determined to be ll of the following apply. t < 4. onent of this laboratory is not in conformity with NSSP 4.
