PART I – QUALITY ASSURANCE							

<u>Co</u>	<u>de</u>	Item Description			
		<u>1.1 Quality Assurance (QA) Plan</u>			
K		<u>1. Written Plan adequately covers all the following: (check $\sqrt{\text{those that apply}}$</u>			
		a. Organization of the laboratory.			
		b. Staff training requirements.			
		c. Standard operating procedures.			
		d. Internal quality control measures for equipment, calibration, maintenance,			
		repair and performance.			
		e. Laboratory safety.			
		f. Internal performance assessment			
		g. External performance assessment			
<u>C</u>		2. QA Plan is implemented.			
		1.2 Work Area			
<u>0</u>		1. Adequate for workload and storage.			
0		2. Clean and well lighted.			
0		3. Adequate temperature control.			
0		4. All work surfaces are nonporous and easily cleaned.			
		1.3 Laboratory Equipment.			
<u>0</u>		1. The pH meter has a standard accuracy of 0.1 unit.			
K		2. pH paper in the appropriate range (i.e. 1-4) is used with minimum accuracy of			
		0.5 pH units.			
K		3. pH electrodes consist of pH half cell and reference half cell or equivalent			
		combination electrode (free from Ag/AgCl or contains an ion exchange barrier			
		to prevent passage of Ag ions into the medium that may result in inaccurate pH			
		readings).			
K		4. pH meter is calibrated daily or with each use. Records maintained.			
K		5. Effect of temperature has been compensated for by an ATC probe or by manual			
		adjustment.			
K		6. A minimum of two standard buffer solutions (2 & 7) are used to calibrate the			
		pH meter. Standard buffer solutions are used once and discarded.			
K		7. Electrode efficiency is determined daily or with each use following either slope			
		or millivolt procedure.			
<u>K</u>		8. The balance provides a sensitivity of at least 0.0001 g at a load of 5 grams.			
<u>K</u>		9. The balance calibration is checked monthly using NIST class S, ASTM class 1			
		or 2 weights or equivalent. Records maintained.			
<u>K</u>		10. Refrigerator temperature is maintained between 0 and 4°C.			
<u>K</u>		11. Refrigerator temperature is monitored at least once daily. Records maintained.			
<u>K</u>		<u>12. Freezer temperature is maintained at -20°C or below.</u>			
0		13. Freezer temperature is monitored at least once daily. Records maintained.			
0		<u>14. All glassware is clean.</u>			
<u>K</u>		15. High performance liquid chromatography system equipped with the following:			
		<u>a. Low dead-volume,</u>			
		b. binary solvent system delivering a pulse-free flow of 0.5-2.0 mL/min,			
		<u>c. solvent degasser,</u>			
		d. autosampler with loop suitable for 5-30 µL injections,			
		e. temperature controlled column compartment capable of controlling			
		temperature between $10 - 50^{\circ}$ C, and			
		<u>f.</u> fluorescence detector able to achieve the required sensitivity at excitation			
		λ =330nm and emission λ =390nm.			
K		16. Post-column reaction system equipped with the following:Reactor module			

capable of maintaining 85°C, b. dual reagent pumps capable of delivering accurate flows of 0.4 mL/min, and c. knitted reaction coil, 1 mL volume, 5 m x 0.5 mm. K 17. Autopipettors are calibrated annually. Records maintained. K 18. Boiling water bath with sufficient volume to cover sample/acid mixture. K 19. Centrifuge capable of holding 50 mL polypropylene tubes and generating ~ 3000 RCF. K 20. Microcentrifuge capable of generating ~16000 RCF. I.4 Reagents and Reference Solution Preparation and Storage Q 1. All solvents and reagents used are analytical or LC grade materials. K 2. Water is distilled or deionized and exceeds 0.5 megaohm resistance or is less than 2 µSiemens/cm conductivity at 25°C to be tested and recorded monthly for resistance or conductivity.
and c. knitted reaction coil, 1 mL volume, 5 m x 0.5 mm. K 17. Autopipettors are calibrated annually. Records maintained. K 18. Boiling water bath with sufficient volume to cover sample/acid mixture. O 1. All solvents and reagents used are analytical or LC grade materials. K 2. Water is distilled or deionized and exceeds 0.5 megaohm resistance or is less than 2 μSiemens/cm conductivity at 25°C to be tested and recorded monthly for resistance or conductivity.
K 2. Water is distilled or deionized and exceeds 0.5 megaohm resistance or is less than 2 μSiemens/cm conductivity at 25°C to be tested and recorded monthly fo resistance or conductivity.
than 2 µSiemens/cm conductivity at 25°C to be tested and recorded monthly for resistance or conductivity.
resistance or conductivity.
\underline{O} $\underline{3. \text{ Water is analyzed for residual chlorine monthly and is at a nondetectable level}}_{(\leq 0.1 \text{ ppm}) \text{ Records maintained.}}$
K4. Water is free from trace (< 0.5 mg/l) dissolved metals specifically, Cd, Cr, Cu,
$\underline{\mathbf{K}}$ $\mathbf{$
mg/l. Records maintained.
O 5. Water contains < 1000 CFU/ml as determined monthly using the heterotrophic
plate count method. Records maintained.
O 6. Reagents are properly stored and labeled with the date of receipt and date
<u>opened.</u>
<u>C</u> <u>7. 0.5 M 1-heptane sulphonate is prepared the day of use or refrigerated.</u>
<u>C</u> <u>8. pH of mobile phases and oxidant are as follows and records maintained:</u>
<u>a. GTX/STX toxins mobile phase A&B is 7.1,</u>
b. C toxins mobile phase A is 5.8, and
c. Oxidant is 7.8.
<u>K</u> 9. Mobile phases and post-column reagents are filtered through 0.2 μm nylon
filter membrane before use.
<u>C</u> <u>10. Only certified reference materials are used for standard solutions. Source</u>
of the reference standard:
<u>K</u> <u>11. All primary standards are stored appropriately as per supplier</u>
recommendations.
<u>K</u> <u>12. Standards are prepared gravimetrically using "Class A" glassware.</u>
<u>K</u> <u>13. Intermediate mixes of primary standards are made up in 0.003 M HCl</u>
(GTX/STX toxins) or Milli-Q water (C toxins), and stored appropriately.
<u>K</u> <u>14. Working standards are made up from primary standard mixes by dilution with</u>
toxin-free, deproteinated mussel or oyster extract (GTX/STX toxins) or Milli-C
water (C toxins).
<u>K</u> <u>15. Working standards are stored in the refrigerator at 4°C.</u>
<u>1.5 Collection and Transportation of Samples</u>
<u><u>O</u> <u>1. Shellstock are collected in clean, waterproof, puncture resistant containers.</u></u>
<u>K</u> <u>2. Samples are appropriately labeled with the collector's name, type of shellstock</u>
the source, the harvest area, time, date and place (if market sample) of
<u>collection.</u>
<u>K</u> <u>3. Immediately after collection, shellstock samples are placed in dry storage</u>
between 0 and 10°C until analyzed.
<u>K</u> <u>4. The time from collection to completion of the assay should not exceed 24</u>
hours. However, if there are significant transportation delays, then shellstock

		samples are processed immediately as follows (circle the appropriate				
		choice):Washed, shucked, drained, frozen until extracted;				
		b. Washed shucked, drained, homogenized and frozen;				
		c. Washed, shucked drained, extracted, the supernatant decanted and				
		refrigerated (best choice); or				
		d. The laboratory has an appropriate contingency plan in place to handle				
		samples which can't be analyzed within 24 hours due to transportation				
		issues.				
		5. Frozen shucked product or homogenates are allowed to thaw completely and all				
		liquid is included as part of the sample before being processed futher.				
PAR		EXAMINATION OF SHELLFISH FOR PSP TOXINS				
		2.1 Preparation of Sample				
<u><u>C</u></u>		1. At least 12 animals are used per sample or the laboratory has an				
		<u>appropriate contingency plan for dealing with non-typical species of</u>				
		shellfish.				
0		2. The outside of the shell is thoroughly cleaned with fresh water.				
0		3. Shellstock are opened by cutting the adductor muscles.				
<u>0</u>		4. The inside surfaces of the shells are rinsed with fresh water to remove sand and				
	$\left \right $	other foreign materials.				
<u>0</u>		5. Shellfish meats are removed from the shell by separating the adductor muscles				
17		and tissue connecting at the hinge.				
<u>K</u>		6. Damage to the body of the mollusk is minimized in the process of opening.				
<u>0</u>		7. Shucked shellfish are drained on a #10 mesh sieve or equivalent without				
V		layering for 5 minutes.				
K		8. Pieces of shell and drainage are discarded.				
<u>C</u>		9. Drained meats or thawed homogentates are blended at high speed until				
		homogenous (60-120 seconds).				
K		<u>homogenous (60-120 seconds).</u> <u>2.2 Digestion of Sample</u>				
<u>K</u>		homogenous (60-120 seconds).				
		homogenous (60-120 seconds). 2.2 Digestion of Sample 1. Sample homogenates are extracted as soon as possible (same day) or stored in the freezer.				
<u>K</u> <u>K</u>		homogenous (60-120 seconds). 2.2 Digestion of Sample 1. Sample homogenates are extracted as soon as possible (same day) or stored in				
<u>K</u>		homogenous (60-120 seconds). 2.2 Digestion of Sample 1. Sample homogenates are extracted as soon as possible (same day) or stored in the freezer. 2. Sample homogenate is extracted in a 1:1 w/v ratio with 0.1 M HCl, preferably				
		homogenous (60-120 seconds). 2.2 Digestion of Sample 1. Sample homogenates are extracted as soon as possible (same day) or stored in the freezer. 2. Sample homogenate is extracted in a 1:1 w/v ratio with 0.1 M HCl, preferably 5g tissue in 5mL acid

	<u>NaOH (70 µL NaOH per 1000 µL aliquot of supernatant), vortexed</u>				
K	 <u>thoroughly and centrifuged at 16,000 g for 5 minutes.</u> 3. An aliquot of the deproteinated, pH-adjusted supernatant is filtered through a 				
	<u>0.2 µm filter into two 2 mL autosampler vials (one vial for GTX/STX analysis</u>				
	and one vial for C-Toxins analysis).				
	<u>and one vial for C-Toxins analysis).</u> 2.4 Assay				
<u>C</u>	1. A calibration is performed upon initial instrument set up, following any				
	<u>1. A canoration is performed upon initial instrument set up, following any</u> major hardware maintenance activity, or when the continuing				
	calibration verification (CCV) indicates significant drift (> 30% for				
	individual toxin) from the calibration. Records maintained.				
K	2. For GTX/STX toxins, no more than ten samples should be made between				
	standard analyses. For C toxins, no more than five samples injections should be				
	made between standard analyses.				
<u>K</u>	3. 10 µL is injected for GTX/STX toxins and 5 µL is analyzed for C-toxins.				
<u>K</u>	4. Samples are stored in the sample compartment at 4°C during analysis.				
<u>0</u>	5. A column heater is used in the analysis.				
<u>0</u>	6. The appropriate analytical column is used.				
	a. GTX/STX Toxins: Zorbax Bonus-RP column, 4.6 mm x 150 mm, 3.5 µm,				
	Agilent catalog number 863668-901 or equivalent.				
	b. C Toxins: BetaBasic 8, 4.6 mm x 250 mm, 5 μm, Fisher catalog number				
	<u>71405-254630 or equivalent.</u>				
	2.5 System Suitability				
<u>K</u>	<u>1. The correlation coefficient for the linear regression (r^2) must be ≥ 0.990 for</u>				
17	each individual toxin.				
<u>K</u>	2. Resolution and Retention Time Criteria.				
	<u>a. GTX/STX Toxins.</u> <u>i. Matrix peak must be at least 70% baseline resolved between GTX3 and</u>				
	<u>1. Matrix peak must be at least 70% baseline resolved between GTX3 and</u> GTX2.				
	ii. GTX5 must be at least 40% baseline resolved between dcGTX3 and				
	dcGTX2.				
	iii. dcSTX and STX must be at least 70% baseline resolved.				
	iv. GTX4 retention time should be between 5 and 7 minutes.				
	b. C Toxins.				
	i. C1 and C2 must be at least 70% baseline resolved.				
	ii. C1 retention time should be between 5 and 8 minutes.				
	2.6 Calculation of Toxicity				
<u>C</u>	1. The toxicity of the individual toxins is calculated as follows:				
	$\frac{372.2 \text{ Fvol} (Wt + Vol)}{Vt + Vol} = 100$				
	$\mu gSTXdiHCle q/100g = \mu M \times \frac{372.2}{1000mL} \times \frac{Fvol}{Ext.vol} \times \left(\frac{Wt + Vol}{Wt}\right) \times ReTx \times 100$				
	<u>Where:</u> $\mu M = Concentration of toxin in the extract, in \mu M;$				
	$\frac{\mu v_{I}}{F v_{O}} = Concentration of toxin in the extract, in \mu v_{I}}{F v_{O}}$ Fvol = Final volume of the deproteinized extract (1120 µL);				
	$\frac{FVOI = FINAL VOLUME OF the deproteinized extract (1120 µL);}{Ext.vol = Volume of crude extract used (1000 µL);}$				
	$\frac{1}{1000 \ \mu L};$ $Wt = Weight of sample used;$				
	Vol = Volume of acid extractant used (e.g. 5 mL); and				
	ReTx = Relative toxicity of toxin vs. Saxitoxin.				
	Relative Toxicity Values				
	Toxin <u>ReTx</u> <u>Toxin</u> <u>ReTx</u>				

			<u>GTX1</u>	<u>0.9940</u>	<u>NEO</u>	<u>0.9243</u>	
			<u>GTX2</u>	<u>0.3592</u>	<u>STX</u>	<u>1.0000</u>	
			<u>GTX3</u>	<u>0.6379</u>	<u>dcSTX</u>	<u>0.5131</u>	
	<u>GTX4</u> <u>0.7261</u> <u>C1</u> <u>0.0060</u>						
			<u>GTX5</u>	<u>0.0644</u>	<u>C2</u>	<u>0.0963</u>	
			dcGTX2	<u>0.1538</u>	<u>C3</u>	<u>0.0133</u>	
			dcGTX3	<u>0.3766</u>	<u>C4</u>	<u>0.0576</u>
