**Proposal Subject** 

NSSP Laboratory Evaluation Checklist

Specific NSSP Guide Reference

NSSP Guide Model Ordinance Chapter III. Laboratory

@ .01 Quality Assurance D. (1)

Text of Proposal/ Requested Action Chapter III@.01.D. (1) add the following to the end of the existing sentence (Laboratory evaluation criteria listed in Section IV Guidance Documents). The suggested NSP checklist is provided in the attached file.

Public Health Significance

An NSSP standardized NSP laboratory evaluation checklist will allow objective evaluation of laboratory conformance with NSSP requirements.

Cost Information (if available)

N/A

Action by 2003 Task Force I Recommended that Proposal 03-107 be referred the appropriate committee as determined by the Conference Chairman.

Action by 2003 General Assembly Adopted recommendation of 2003 Task Force I.

Action by USFDA

Concurred with Conference action.

Action by 2005 Lab Methods Review and Lab QA Committees Recommended adoption of the revised Neurotoxic Shellfish Toxins (mouse bioassay) laboratory evaluation checklist as amended. The revised checklist is attached below.

Action by 2005 Task Force I Recommended adoption of the Lab Quality Assurance Committee recommendation on Proposal 03-107.

Action by 2005 General Assembly Adopted recommendation of 2005 Task Force I.

Action by USFDA

FDA concurs with adoption and incorporation of a Neurotoxic Shellfish Poisoning (NSP) laboratory checklist into the NSSP with the following changes. Changes 1 through 5 are editorial. Changes 6 and 7 are needed to restore universal applicability of the checklist to all laboratories involved in NSP testing.

- 1. Under the heading **Quality Assurance (QA) Plan** p. 33 add an item "g. External performance assessment". This was inadvertently left out of the Committee report and is consistent with both the Microbiology and PSP Checklists.
- 2. Under the heading <u>Digestion of Sample</u>, page 34, Item #2 add the word "of" before homogenized as an editorial change.
- 3. Under the heading <u>Digestion of Sample</u>, page 34, Item #3, add the word "concentrated" before HCl. This change is needed to be consistent with the official procedure which requires the use of concentrated (12 N) HCl.
- 4. Under the heading **Digestion of Sample**, page 34, Item #4, add the word "for" after the words gently boil as an editorial change.
- 5. Under the heading <u>Bioassay</u>, page 35, item #8.b, add the word "*test*" after the phrase "2 of 2" as an editorial change to distinguish the type of mice being used for determining the appropriate dilution for the toxin.
- 6. Under the heading <u>Work Area</u>, page 33, delete item #5. This item has no relevance outside of the FWRI toxin laboratory and as such needs to be deleted to maintain the applicability of the Checklist to all laboratories involved in NSP testing.
- 7. Under the heading **Extraction**, page 34, item #1, delete the remainder of the sentence after the word ventilation. This change does not alter the intent of item #1but, restores its applicability to all laboratories performing NSP bioassays without the benefit of an NSP dedicated laboratory as part of the facility.

## DRAFT Analysis for Neurotoxic Shellfish Toxins – Mouse Bioassay

* Indica	ates that this is not in the <i>Recommended Procedures</i> , 4 <sup>th</sup> Edition
Weighted code	Item Description
	Quality Assurance (QA) Plan
С	1. Written Plan adequately covers the following (check those that apply):
	a Organization of the laboratory.
	b Staff training requirements.
	c. Standard operating procedures.
	d Internal quality control measures for equipment, calibration,
	maintenance, repair and performance. e Laboratory safety.
	f External FDA proficiency testing. Internal performance assessment.
C*	
C <u>*</u>	2. QA Plan is implemented.
О	Work Area  1. Adequate for workload and storage.
<u>O*</u>	Clean and well lighted.
<u>O*</u>	3. All work surfaces are nonporous and easily cleaned.
<u>K*C</u>	4. A separate, quiet area with adequate temperature control is maintained for
1 <u>c</u>	acclimation and injection of mice.
C <u>*</u>	5. Following CIS guidelines, a closed system, e.g., room with adequate ventilation
	With explosion- proof electrical equipment and lighting has to be used for diethyl ethe
	extractions. All electrical outlets and switches have to be on the outside of the room to
	avoid sparks and the fume hood should be without electrical service in the hood.
	Laboratory Equipment
K	1. The differing sensitivities in weight measurements required by various steps in
	the extraction procedure as well as the bioassay are met by the balances being
	used.
	a To determine sample weight, a sensitivity of at least 0.1 g at load of 100 g is required.
	b. To determine the weight of the lipid extract and its subsequent volume
	adjustment, a sensitivity of at least 10 mg at loads of 1 and 10 g is
	required.
	c To determine the weight of the mice used in the bioassay, a
	sensitivity of 0.1 g at a load of 20 g is required.
O <u>*</u>	2. The calibrations of the balances are checked monthly using NIST Class S or
	ASTM Class 1 or 2 weights or equivalent. Records are maintained.
<u>K</u> <u>*</u>	3. The temperature maintained by the refrigerator is between 0 and 5°C.
O <u>*</u>	4. Refrigerator temperature is monitored at least once daily. Temperatures are
	recorded and records are maintained.
K	Reagents  1. Concentrated (12N) HCl is used to acidify the homogenate.
0	Reagent grade NaCl is used in the extraction procedure.
C	3. Diethyl ether purified for lipid extraction is used for extracting lipids from
	the shellfish homogenates.
C <u>*</u>	4. Cottonseed oil (0.917 g/ml) or a solvent with a similar density (0.915 to 0.927 g/ml) i
	used as the toxin delivery system. Name of the solvent if substituted for cottonseed oil
	Specify Delensity
	Collection and Transportation of Samples
<u>O*</u>	Shellstock are collected in clean, waterproof, puncture resistant containers.
K≛	2. Samples are appropriately labeled with the collector's name, the harvest area and
Tr. de	the time and date of collection.
K≛	3. Immediately after collection, shellstock samples are placed in dry storage
	between 0 and 10°C until analyzed.

Г	
K*	4. Shellstock samples are analyzed within 24 hours of collection or
	refrigerated unshucked until analyzed.
K≛	5. Refrigerated storage of shellstock does not exceed 48 hours.
K≛	6. If shellstock is refrigerated, only live animals are used in the analysis.
K≛	7. If shellfish are shucked in a location other than the laboratory, they must be
	prepared according to steps 1-9 in "Preparation of Sample" section below.
	Samples are then double bagged.
	Preparation of Sample
C <u>*</u>	1. At least 12 animals are used per sample and a minimum of 100 grams of meat.
О	2. The outside of the shell is thoroughly cleaned with fresh water.
K <u>*</u>	3. Shellstock are opened by cutting the adductor muscles.
С	4. Shell liquor is discarded.
O <u>*</u>	5. The inside of the shells is rinsed with fresh water to remove sand or other
	foreign material.
K≛	6. Shellfish meats are removed from the shell by separating the adductor muscles
	and tissue connecting at the hinge.
K≛	7. Damage to the body of the mollusk is minimized in the process of opening.
<u>K</u>	8. $100 - 150$ grams of meat are collected or all the available sample if there is less than
	100 grams.
О	89. Shucked shellfish are drained on a #10 mesh sieve or equivalent without layering
	for 5 minutes.
K≛	910. Pieces of shell and drainings are discarded.
С	1011. Drained meats are blended at high speed until homogenous (60-120)
	seconds).
<u> </u>	1112. Shellfish homogenates are digested the same day they were blended within 2 hours of
	blending.
	Digestion of Sample
K <u>*</u>	1. All glassware used is clean and properly washed with a succession of at least
	three fresh water rinses, 1.2 N HCl, and a final distilled/deionized rinse to
	ramaya ragidual datargant
	remove residual detergent.
K	2. 100 grams (or entire sample amount if less than 100 grams is available)
	2. 100 grams (or entire sample amount if less than 100 grams is available) homogenized sample is weighted into a beaker.
